for demo purpose,i need data(images) for the above Invoice and receipt intake bot.Suggest website from where i can get the data for testing?

For a demo, use a **small mixed test set**: real-looking receipts, invoices, and intentionally poor-quality images. The best starting sources are **ExpressExpense's free receipt images**, **Roboflow Universe's Receipt-or-Invoice dataset**, and **RVL-CDIP** for invoice-style scanned documents.[1] [2] [3]

Recommended sources

Source	Best for	What you get	Notes
ExpressExpense free receipt images	Receipt-photo demos	Real receipt photographs compiled for OCR and ML research	Good for testing "receipt," readability, and total-visible checks. [2]
Roboflow Universe: Receipt-or-Invoice	Receipt vs. invoice classification	Community-labeled receipt and invoice images	Useful for a quick binary classification demo. [1] [2]
RVL-CDIP on Hugging Face	Invoice-like scanned documents	400,000 labeled document images across 16 classes, including 25,000 invoices	Large download; use only a small invoice subset for a demo. [3]
RVL-CDIP invoice-only subset	Invoice-only testing	Invoice images extracted from RVL-CDIP	Easier than downloading the full 38 GB+ dataset. [4]
Kaggle: 497 English Invoice Images	Clean invoice visuals	497 JPG invoice images with personal information desensitized	License is CC BY-NC 4.0, so avoid using it in a commercial product. [5]
Kaggle: Multi-Document Dataset	Safe synthetic demo data	Synthetic invoice, receipt, bank statement, and other document images	Explicitly contains no real personal or financial data, making it convenient for public demos. [6]

Best demo set

Build a folder like this:

```
demo_documents/
├── receipts/
│   ├── receipt_01.jpg
│   ├── receipt_02.jpg
│   └── receipt_blurry.jpg
```

```
├── invoices/
│   ├── invoice_01.jpg
│   ├── invoice_02.jpg
│   └── invoice_scan.jpg
└── other/
    ├── letter.jpg
    ├── form.jpg
    └── screenshot.png
```

A practical target is **20–40 images total**:

- 10 clear receipts.
- 10 invoices.
- 5 blurry, cropped, dark, or rotated images.
- 5 non-financial documents such as letters, forms, or screenshots.

This lets you demonstrate all routing paths: auto-route, manual review, request a better image, and exception queue.

How to use them

1. Download **10–15 receipt photos** from ExpressExpense and **5–10 receipt/invoice images** from Roboflow Universe. [2] [1]
2. Download a **small invoice-only sample** from the RVL-CDIP invoice subset rather than the full RVL-CDIP corpus. [4]
3. Add a few non-invoice/non-receipt images from RVL-CDIP's other categories to test the "other document" route. [3]
4. Create degraded copies yourself using Python or an image editor: blur, darken, crop the total, rotate, or lower resolution.
5. Keep a `labels.csv` with the expected class and expected routing outcome so you can show accuracy during the demo.

Important licensing note

RVL-CDIP is a subset of IIT-CDIP and has an "other" license, so review its license terms before using it beyond a private demo or research project. The Kaggle invoice dataset is CC BY-NC 4.0, meaning it is non-commercial; use synthetic or self-created documents if you plan to publish the app or use it in a company setting. [5] [7] [3]

Safest option for public demos

Use the **Kaggle Multi-Document Dataset** or create your own sample invoices/receipts with clearly fictional vendors, addresses, invoice numbers, and amounts. It is described as synthetic and free of real personal or financial information, which reduces privacy and compliance concerns when sharing screenshots or a live demo. [6]
