# i used python for this -CSV-to-SQL Server data-migration application

Thanks for the correction—use **Python**, not C#/.NET, for that project. That makes it a stronger data-engineering/ETL credential, especially when paired with SQL Server. Strong bullets should name the action, technology, scope, and measurable result. [1] [2]

## Corrected résumé bullets

Use one main bullet plus optional supporting bullets:

> **Developed a Python-based CSV-to-SQL Server data-migration application** that automated ingestion of module-wise files into staging tables, validated source data, and archived processed files, reducing manual migration effort and improving data traceability.

More detailed versions:

- **Built a Python ETL/data-migration application** to ingest CSV files from business modules such as sales and policy into SQL Server staging tables, automating manual file-loading workflows.
- **Implemented file validation, batch processing, error handling, and automated archiving**, ensuring only complete and valid files were loaded while preserving an audit trail for each migration batch.
- **Developed SQL-based reconciliation checks** comparing source CSV row counts and key totals with SQL Server target tables, improving confidence in data completeness and accuracy. [3] [4] [5]
- **Processed N CSV files / N records across M business modules**, reducing manual migration time by X hours per batch or X% per cycle.

If you do not yet have a business metric, use real scope instead of inventing one: “processed 20+ CSV files per batch,” “supported 5 business modules,” or “reduced a 2-hour manual process to an automated workflow.” Scope, volume, and reliability metrics are all acceptable when they are accurate. [2] [6]

## Best compact version

For a one-page résumé:

> **Built a Python-based CSV-to-SQL Server data-migration application** with module-wise ingestion, staging-table loading, source-to-target reconciliation, error handling, and automated archiving, replacing manual data-migration steps.

### Skills wording

Update your skills section to:

```
Languages: Python, SQL
Data Engineering: ETL, CSV ingestion, data migration, staging tables,
data validation, reconciliation, batch processing
Database: Microsoft SQL Server
Libraries/Tools: pandas (if used), pyodbc/sqlalchemy (if used),
openpyxl (if used), Git
```

Only list libraries you actually used. If you used only standard Python plus a SQL Server connector, write **Python, SQL, SQL Server, ETL/data migration, data validation**—that is enough. Recruiters value applied SQL and Python experience over a long list of tools. [6] [1]

### Interview-ready phrasing

Say:

> "I built a Python-based ETL tool that reads module-specific CSV files, validates them, loads them into SQL Server staging tables, performs reconciliation checks, and archives successfully processed files. It made the migration process repeatable and reduced manual handling."

This positions the project as **data engineering and data quality automation**, which is highly relevant to AI work in reinsurance because reliable data pipelines are a prerequisite for trustworthy AI systems. [7] [2]
